WHAT IS THE EXPERIENCE CURVE?

Reduced to its essential the Experience Curve, sometimes called the learning or improvement curve, is based on the theory that each time the total quantity of units produced is doubled, the hours or cost to produce the last unit of this doubled quantity will be reduced by a constant percentage. A 20% decrease in the effort to produce double quantities is referred to as an 80% slope, a 15% decrease as an 85% slope, and so on.

Suppose, for example, that a contractor operates on an 80% experience curve, he is manufacturing a new item, and that it took 100 direct man-hours to produce the first unit. If production follows an 80% experience curve, the second unit will take only 80 hours to produce. Likewise, Unit Number 4 should take only 64 hours, or 80% as much time as Unit Number 2. This process continues on to the 8th, 16th, 32nd unit, etc. Figure 1 illustrates this example.

One might think it unreasonable to expect this time reduction to go on indefinitely since it would appear at first glance that the time to produce a unit would get exceedingly small very fast, but such is not the case. The quantity of units must be doubled in order to get this 20% decrease in production time, so that although the time required to produce a unit steadily decreases, the quantities necessary to get these reductions in time rapidly approaches an infinitely large number. This is also illustrated in Figure 1.

The pattern of the Experience Curve is hyperbolic when drawn on arithmetical graph paper and is a straight line when drawn on logarithmic (log-log) paper. It is represented by the formula $Y = AX^B$.

Some of the factors that contribute to the decline of the unit cost as cumulative production increases are:

1. Workers become more familiar with the job due to repetition.
2. Development of more efficient tools and machines.
3. Improvement in organization and management.
4. Solution of engineering problems.

80% EXPERIENCE CURVE

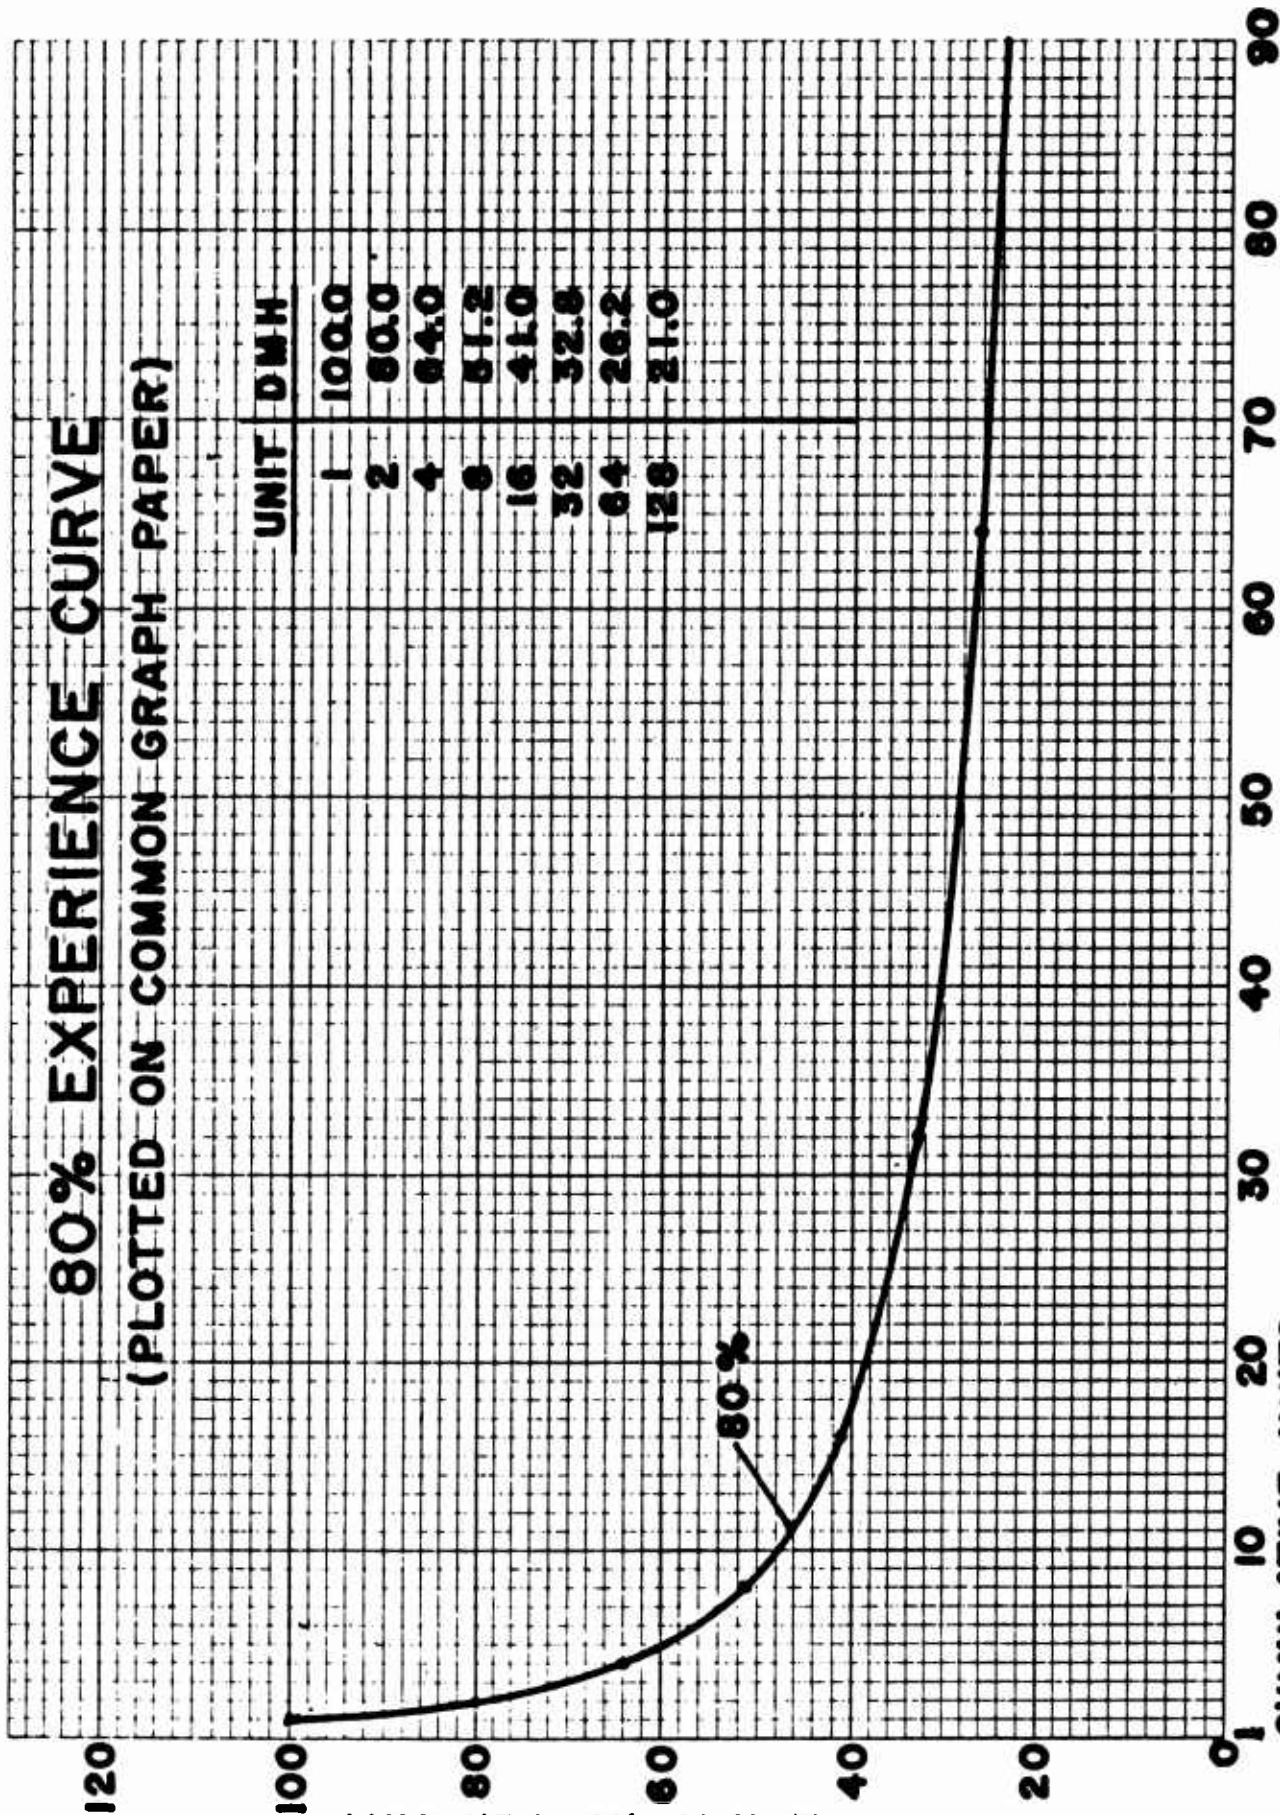

(PLOTTED ON COMMON GRAPH PAPER)

| UNIT | DMH |
|------|-------|
| 1 | 100.0 |
| 2 | 80.0 |
| 4 | 64.0 |
| 8 | 51.2 |
| 16 | 41.0 |
| 32 | 32.8 |
| 64 | 26.2 |
| 128 | 21.0 |

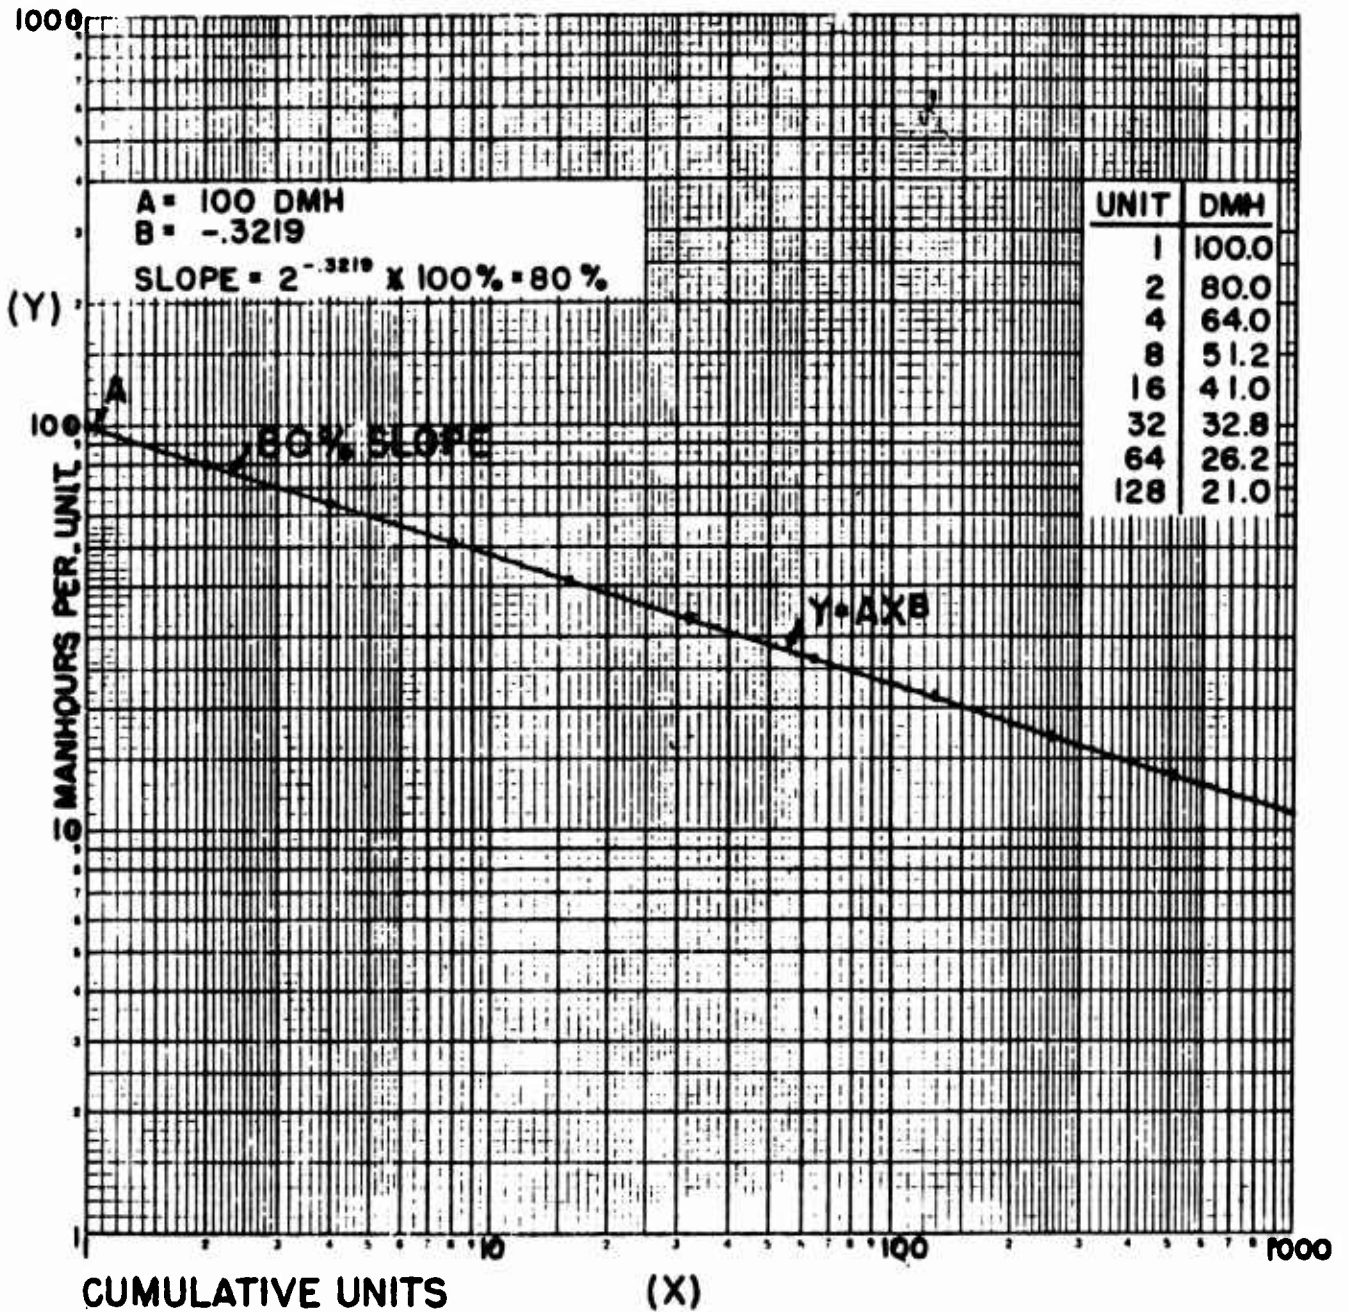

FIGURE 2

SOLUTION OF THE EXPERIENCE CURVE USING EMPIRICAL DATA

The Experience Curve data, as drawn on arithmetical graph paper (Figure 1), forms a hyperbolic curve, and is very difficult to extrapolate or forecast upon. Another disadvantage of the arithmetical graph paper is that it is difficult to plot a large number of units. For these and other reasons, it has been found more convenient to use logarithmic (log-log) graph paper.

One of the major differences between arithmetical graph paper and the log-log paper is that log-log paper is constructed so that the distances between double quantities are equal. It is for this reason that the experience curve follows a straight line on log-log paper. Therefore, log-log paper has two prime advantages. First, the experience curve becomes a straight line and can therefore be extended to any amount with the use of a straight-edge. Second, a large number of units can be plotted on one sheet of log-log paper since higher numbers are "squeezed" together, both horizontally and vertically.

Figure 2 illustrates the Experience Curve plotted on log-log paper. The same data is used as in Figure 1. This improvement over the arithmetic plot and its simplicity is of great advantage to the analyst.

From analysis of empirical data, it has been found that the Experience Curve could be expressed by the equation:

$$Y = AX^B \quad \text{Eq. (1)}$$

or

$$\text{Log } Y = \text{Log } A + B \cdot \text{Log } X \quad \text{Eq. (2)}$$

The mathematical method of fitting actual data to the equation $Y = AX^B$ to determine the experience curve slope is called log-log least squares regression. The following two equations are the least squares solution for the slope exponent (B) and the theoretical unit number one (A) man-hours (or cost).

$$B = \frac{N \cdot \sum(\text{Log } X \cdot \text{Log } Y) - \sum(\text{Log } X) \cdot \sum(\text{Log } Y)}{N \cdot \sum(\text{Log } X) - \sum(\text{Log } X) \cdot \sum(\text{Log } X)} \quad \text{Eq. (3)}$$

$$\text{Log } A = \frac{\sum(\text{Log } Y) - B \cdot \sum(\text{Log } X)}{N} \quad \text{Eq. (4)}$$

Where: Y = Man-hours (or cost) to produce unit X
 X = Unit number corresponding to Y
 N = Number of actual points of data
 A = Theoretical man-hours (or cost) to produce unit No. 1
 B = Exponent of Experience Curve Slope

NOTE: B will be negative for all slopes below 100%.

Table I can be used in conjunction with B to determine the experience curve percentage slope value. If B is outside the range of the table or the table is not available, application of Equation 5 will convert the slope from an exponent to its percentage value.

$$\% \text{ Slope} = 2^B \times 100\% \quad \text{Eq. (5)}$$

As it often happens, data may be collected in lot quantities rather than the individual unit data. When this happens, it is necessary to determine the Algebraic or "True" lot mid-point (K) before solving Equations 3 and 4. This can be done either by using the Experience Curve Factor Tables (Table III) or applying Equation 6.

In both cases, it is necessary to estimate the slope of the experience curve. This can be done by either graphing the data on log-log paper and approximating the slope with a ruler, or using Equation 3 and substituting the "arithmetic" lot mid-point for X. Having determined an approximate B, Equation 6 or the table may be used. The lot mid-point equation involves a considerable amount of calculation, so it is more advantageous to use the tables where possible.

$$K = \left[\frac{(N) \cdot (1 + B)}{(L + .5)^{1+B} - (F + .5)^{1+B}} \right]^{-\frac{1}{B}} \quad \text{Eq. (6)}$$

Where: B = Approximate exponent of experience curve slope
 N = Number of units in lot
 F = First unit in lot
 L = Last unit in lot
 K = Algebraic or "True" lot mid-point

The Experience Curve Tables (Table III) may be used to determine the Algebraic lot mid-point for each lot in the following manner:

1. Locate the approximate slope of the experience curve in the tables.
2. Locate the Cum Total factor for the last cumulative unit of the lot.
3. Locate the Cum Total factor for one less than the first cumulative unit of the lot.
4. Subtract this Cum Total factor from Cum Total factor of last unit in lot and divide result by total number of units in the lot.
5. Look up this figure in the Unit Factor Column for the same slope.
6. Having located the factor which is closest, look across to the unit number which corresponds to this factor. This unit number is the Algebraic or "True" mid-point (K) of the lot.

EXAMPLES OF EXPERIENCE CURVE CALCULATIONS USING EMPIRICAL DATA

GIVEN: 4 points of data:

1. Average DMH for Lot #2 (units 12 through 100) = 5,100 DMH/Unit.
2. Average DMH for Lot #3 (units 101 through 200) = 2,700 DMH/Unit.
3. Average DMH for Lot #5 (units 301 through 400) = 1,800 DMH/Unit.
4. Average DMH for Lot #6 (units 401 through 550) = 1,500 DMH/Unit.

I. Compute:

- A. Percent slope of data.
- B. Theoretical man-hours for Unit #1.

II. Compute by formula method and by use of tables:

- A. Projected man-hours for Unit #1,000.
- B. Algebraic (true) lot mid-point for Lot #7 (units 551 through 700).
- C. Average man-hours per unit for Lot #7.
- D. Projected total man-hours for Lot #7.
- E. Unit man-hours for Unit #700.
- F. Cumulative average man-hours for Unit #700.

III. Plot Experience Curve.

NOTE: Answers derived from the Experience Curve Tables will differ slightly from answers derived through calculations because the Experience Curve Factors are applicable to specific slopes (i.e. 80%, 82%, 90%, etc.) while calculated slopes usually apply to fractional parts of slopes (i.e. 80.1%, 82.3%, 90.5%, etc.)

I. To find the percent slope and the theoretical man-hours for Unit #1:

A. Determine the true lot mid-points for each lot by using the Experience Curve Factor tables.

1. Estimate an approximate percent slope for the curve. (Plotting the data on Log-Log paper at their Arithmetic lot mid-point indicates an approximate slope of 70%.)

2. Use Procedure #12 (Reference page 20) to determine the mid-point.

| | | | |
|----------------------------|---------|-------------|------------------|
| Last unit in lot | #100 | 17.79070759 | Cum Total Factor |
| Last unit in preceding lot | - # 11 | 5.22292805 | Cum Total Factor |
| Number of units in lot #2 | 89 | 12.56777954 | |
| True lot mid-point | = (#45) | .14121101 | Unit Factor |

| | | | | | |
|-------|-------------|-------|-------------|-------|-------------|
| 200 | 25.48201299 | 400 | 36.25963153 | 550 | 42.56801558 |
| 100 | 17.79070759 | 300 | 31.34231043 | 400 | 36.25963163 |
| 100 | 7.69130540 | 100 | 4.91732120 | 150 | 6.30838395 |
| (146) | .07691305 | (349) | .04917321 | (473) | .04205589 |

B. Having determined the Algebraic lot mid-points, use Equation 3 to determine the B Factor of the curve, and Equation 5 to determine the percent slope (Reference Computation Form, page 9).

$$B = \frac{n \cdot \Sigma(\text{Log } X \cdot \text{Log } Y) - \Sigma(\text{Log } X) \cdot \Sigma(\text{Log } Y)}{n \cdot \Sigma(\text{Log } X)^2 - (\Sigma(\text{Log } X))^2} \quad \text{Eq. (3)}$$

$$B = \frac{4 \cdot (30.329278) - (9.035252) \cdot (13.570298)}{4 \cdot (21.038377) - (9.035252) \cdot (9.035252)} = \frac{-1.293950}{2.517729}$$

$$B = -.513935$$

$$\% \text{ Slope} = 2^B \times 100\% \quad \text{Eq. (5)}$$

$$\begin{aligned} \text{Log } (\% \text{ Slope}) &= B \cdot \text{Log } (2) + \text{Log } (100) \\ &= (-.513935) \cdot (.301030) + 2.000000 \\ &= 1.845290 \end{aligned}$$

$$\% \text{ Slope} = \boxed{70.031\%}$$

C. Use Equation 4 to calculate A, the theoretical man-hours for Unit #1.

$$\text{Log A} = \frac{\Sigma(\text{Log Y}) - B \cdot \Sigma(\text{Log X})}{N} \quad \text{Eq. (4)}$$

$$\text{Log A} = \frac{13.570298 - (-.513935) \cdot (9.035252)}{4} = 4.553457$$

$$A = \boxed{35,765 \text{ man-hours}}$$

D. Since Equation 3 and 4 involve numerous logarithmic summations, Form I (Production Experience Curve Calculations) should be used for tabulation and computation of the Experience Curve. Also, Table I (Experience Curve Exponents) should be used where possible to determine the percent slope instead of Equation 5.

II. To make the required projections by use of Tables:

A. To calculate the projected man-hours for Unit #1000, use Procedure #1 (page 17).

| | |
|----------------------------|-----------------|
| Unit factor for Unit #1000 | .02859436 |
| Man-hours for Unit #1 | <u>x 35,765</u> |
| Man-hours for Unit #1000 | = <u>1023</u> |

B. To compute the Algebraic lot mid-point of Lot #7, use Procedure #12 (page 20).

| | | | |
|----------------------------|--------------|-------------|------------------|
| Last unit in lot | 700 | 48.03871870 | Cum Total Factor |
| Last unit in preceding lot | - 550 | 42.56801558 | Cum Total Factor |
| Number of units in lot | 150 | 5.47070312 | |
| True lot mid-point | = <u>623</u> | .03647135 | Unit Factor |

C. To compute the average man-hours per unit for Lot #7, multiply the unit factor of the algebraic lot mid-point by the man-hours to produce Unit #1.

| | |
|---------------------------------------|-----------------|
| Unit factor of true lot mid-point | .03647135 |
| Man-hours to produce Unit #1 | <u>x 35,765</u> |
| Average man-hours per unit for Lot #7 | = <u>1304.4</u> |

D. To compute the total man-hours of Lot #7, multiply the average man-hours per unit of the lot by the number of units in the lot.

| | |
|--------------------------------------|------------------|
| Average man-hours per unit of Lot #7 | 1304.4 |
| Number of units in lot | <u>x 150</u> |
| Total man-hours in lot | = <u>195,660</u> |

E. To compute the man-hours required for Unit #700, use Procedure #1 (page 17).

| | |
|----------------------------------|-----------------|
| Unit factor for Unit #700 | .03435491 |
| Man-hours for Unit #1 | <u>x 35,765</u> |
| Man-hours required for Unit #700 | = <u>1,229</u> |

F. To compute the cumulative average man-hours required for 700 units, use Procedure #2 (page 17).

| | |
|--|-----------------|
| Cum Average factor for Unit #700 | .06862674 |
| Man-hours for Unit #1 | <u>x 35,765</u> |
| Cum Average man-hours required for 700 units | = <u>2,454</u> |

II. To make the required projections by use of equations:

A. To calculate the projected man-hours for Unit #1,000, use Equation 1.

$$Y = AX^B$$

Eq. (1)

$$\text{Log } Y = \text{Log } A + B \cdot \text{Log } X$$

Eq. (2)

$$= \text{Log } (35,765) + (-.513935) \cdot \text{Log } (1000)$$

$$= 4.553457 + (-.513935) \cdot (3.000000)$$

$$= 4.553457 - (1.541805) = 3.011652$$

$$Y = \underline{1,027} \text{ DMH for Unit \#1000}$$

B. To compute the Algebraic lot mid-point of Lot #7, use Equation 6.

$$K = \left[\frac{(N) \cdot (1 + B)}{(L + .5)^{1+B} - (F + .5)^{1+B}} \right]^{-\frac{1}{B}} \quad \text{Eq. (6)}$$

$$= \left[\frac{(150) \cdot (.486065)}{(700.5)^{.486065} - (550.5)^{.486065}} \right]^{-\frac{1}{-.513935}}$$

$$\text{Log } c_1 = (.486065) \cdot \text{Log } 700.5 = (.486065) \cdot (2.845408) = 1.383053$$

$$c_1 = 24.1575$$

$$\text{Log } c_2 = (.486065) \cdot \text{Log } 550.5 = (.486065) \cdot (2.740757) = 1.332186$$

$$c_2 = 21.4875$$

$$c_1 - c_2 = 2.6700$$

$$K = \left[\frac{72.9097}{2.6700} \right]^{\frac{1}{-.513935}} = [27.3070]^{\frac{1}{-.513935}}$$

$$\text{Log } K = \frac{\text{Log } (27.3070)}{.513935} = \frac{1.436274}{.513935} = 2.794660$$

$$K = \underline{623.25} = \text{Lot mid-point for Lot \#7}$$

C. To compute the average man-hour per unit for Lot #7, use Equation 1, substituting K (computed above) for X.

$$Y = A \cdot X^B \quad \text{Eq. (1)}$$

$$\text{Log } Y = \text{Log } A + B \cdot \text{Log } X \quad \text{Eq. (2)}$$

$$\begin{aligned} &= \text{Log } (35,765) + (-.513935) \cdot \text{Log } (623.25) \\ &= 4.553457 + (-.513935) \cdot (2.794660) = 3.117183 \\ Y &= \underline{1310} = \text{Average man-hours per unit for Lot \#7} \end{aligned}$$

D. To compute the total man-hours of Lot #7, simply multiply the average man-hours per unit of the lot by the number of units in the lot.

$$\begin{aligned} Y_T &= Y \cdot N \\ &= (1310) \cdot (150) = \underline{196,500} = \text{Total DMH in Lot \#7} \end{aligned}$$

E. To compute the man-hours for Unit #700, use Equation 1.

$$Y = A \cdot X^B \quad \text{Eq. (1)}$$

$$\text{Log } Y = \text{Log } A + B \cdot \text{Log } X \quad \text{Eq. (2)}$$

$$\begin{aligned} &= \text{Log } (35,765) + (-.513935) \cdot \text{Log } (700) \\ &= 4.553457 + (-.513935) \cdot (2.845098) \\ &= 3.091298 \\ Y &= \underline{1234} = \text{MAN-HOURS for Unit \#700} \end{aligned}$$

F. To compute the cumulative average man-hours for 700 Units, compute the algebraic midpoint, K, for the unit range 1 through 700; then use Equation 1, substituting K for X.

$$K = \left[\frac{(700) \cdot (1 + B)}{(700.5)^{1+B} - (.5)^{1+B}} \right]^{-\frac{1}{B}} = [14.513407]^{-\frac{1}{B}} \quad \text{Eq. (6)}$$

$$K = 182.2$$

$$Y = A \cdot X^B \quad \text{Eq. (1)}$$

$$\text{Log } Y = \text{Log } A + B \cdot \text{Log } X \quad \text{Eq. (2)}$$

$$\begin{aligned} &= \text{Log } (35,765) + (-.513935) \cdot \text{Log } (182.2) \\ &= 4.553457 + (-.513935) \cdot (2.260548) \\ &= 3.391682 \\ Y &= \underline{2464} = \text{Cum Average man-hours for Unit \#700} \end{aligned}$$

III. To Plot the Experience Curve:

A. Plot on log-log paper any two or more calculated points (e.g. Units 1, 700, 1000) for the unit man-hour curve and connect these points by a straight line. All calculated points should fall on the same straight line.

B. Plot input data at their true lot mid-points.

C. Plot projection for Lot #7 at the true lot mid-point.

D. Figure 3 illustrates the plotting of the Experience Curve.

NOTE OF CAUTION:

It should be noted that the Experience Curve as a forecasting technique requires careful and intelligent usage, and that the results obtained must, of necessity, stand up to the scrutiny of sound judgment.

DIRECT MANHOUR EXPERIENCE CURVE

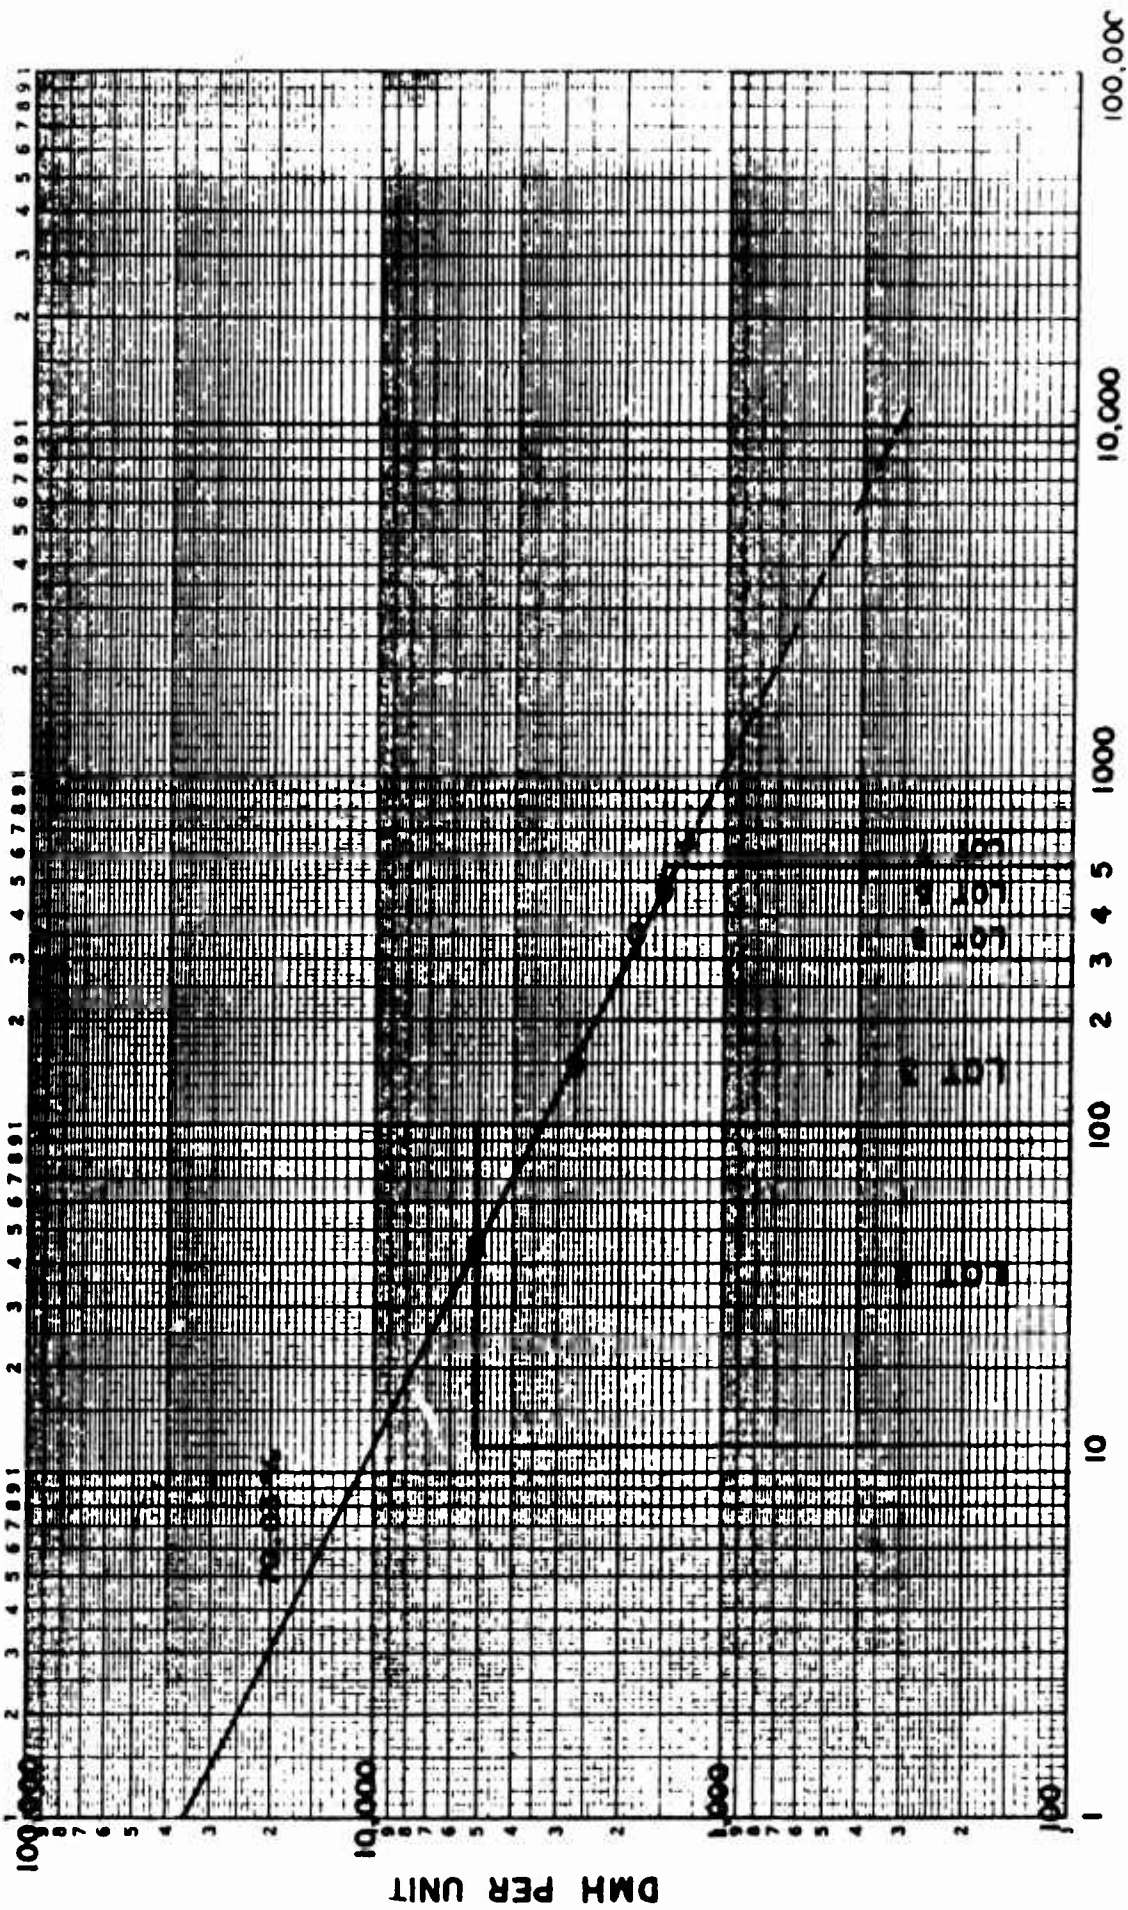

FIGURE 3

DEFINITION OF TERMS:

1. Experience Curves - Are curves that can represent the following:
 - a. The unit direct man-hours (or cost) of each unit,
 - b. The cumulative average man-hours (or cost) per unit of all units through a specific unit number, or
 - c. Cumulative total man-hours (or cost) of all units produced through a specific unit.
2. Unit Man-Hours (or Cost) - The total direct labor hours (or cost) used to complete any specific unit.
3. Cumulative Total Man-Hours (or Cost) - The total man-hours (or cost) for all units produced through any given unit number.
4. Cumulative Average Man-Hours (or Cost) - The average man-hours (or cost) per unit for all units produced through any given unit number (i.e. Cumulative Total Man-Hours (or Cost) divided by given unit number).
5. Lot - A group of consecutive units designated by the first and last unit of the group.
6. Average Unit Man-Hours (or Cost) of a Lot - Total man-hours to produce the lot divided by the number of units in the lot.
7. Arithmetic Lot Mid-Point - Arithmetical center of lot. (Example: Lot of 100 Units beginning with Unit 51 and ending with 150; Arithmetical Lot Mid-point = $(51 + 150)/2 = 100.5$.)
8. Algebraic Lot Mid-Point - Sometimes referred to as "Computed" or "True" lot mid-point. The unit which corresponds to the Average Unit Man-Hours (or Cost) of the lot. Designated by the letter K.
9. % Slope of Curve - A percent figure which represents the steepness of the experience curve. This percent represents the value of each doubled production quantity in relation to the previous quantity. For Example: With an experience curve having a 75% slope, the value at unit number two is 75% of number one; number four is 75% of number two; number one-thousand is 75% of number five hundred. Represented by the formula $\% \text{ Slope} = 2^B \times 100\%$, where B is the exponent of the slope.
10. Exponent - The "B" factor of the slope. Represents the slope or tangent of the logarithmic curve.
11. Unit Number One Man-Hours (or Cost) - The total man-hours (or cost) expended to complete the first unit. Designated by the letter A.
12. Unit Curve - A line drawn on a graph connecting points representing the individual man-hours (or cost) of each unit. Represented by the equation: $Y = AX^B$.

13. Cumulative Average Curve - A line drawn on a graph connecting points representing the cumulative average man-hours (or cost) through each successive unit. Represented by the equation: $\bar{Y} = (\sum_1^N AX^B) / N$.

14. Cumulative Total Curve - A line drawn on a graph connecting points representing the cumulative total man-hours (or cost) through each successive unit. Represented by the equation: $CT = \sum_1^N AX^B = N \cdot \bar{Y}$.

15. Experience Curve Factors - Decimal figures, in Table III, which are used to calculate the various man-hour (or cost) values on the different experience curve slopes.

a. Unit Factor - On any given experience curve the Unit Factor at a specific unit number, multiplied by the man-hours (or cost) at unit number 1, will give the unit man-hour (or cost) of that specific unit.

b. Cumulative Average Factor - On any given experience curve, the C. A. Factor at a specific unit number, multiplied by the man-hours (or cost) at unit number 1, will give the cumulative average man-hours (or cost) of that specific unit.

c. Cumulative Total Factor - On any given experience curve the Cumulative Total Factor at a specific unit number, multiplied by the man-hours (or cost) of all units through that specific unit.

16. Experience Curve Extension Factors - Decimal figures which are used to extend the Unit Curve Factor beyond the range of the tables. Table II contains the extension factors for the various slopes. This factor multiplied by any unit curve factor will give the unit factor for a unit ten times as large.

PROCEDURES FOR THE USE OF THE EXPERIENCE CURVE FACTOR TABLES

The following will illustrate the methods by which the experience curve factor tables may be used to solve almost any type experience curve problem. An 80% slope is used in the examples below.

1. How to determine the cost for a specific unit, given the cost of the first unit.

The Cost for a specific unit can be found - by MULTIPLYING the Cost of Unit #1 by the UNIT Factor of the desired unit.

EXAMPLE: Find the cost of the 1000th unit, using a number one unit of 2,000 dollars and an 80% Experience Curve.

| | |
|------------------------|------------------|
| UNIT Factor Unit #1000 | .10819712 |
| Cost of #1 Unit | <u>x \$2,000</u> |
| Cost of Unit #1000 | = \$216 |

2. How to determine the cumulative average cost per unit, given the cost of the first unit.

The Cumulative Average Cost of a given number of units can be found - by MULTIPLYING the Cost of Unit #1 by the CUMULATIVE AVERAGE factor of the desired number of units.

EXAMPLE: Find the Cumulative Average Cost per unit for 1000 units using a number one unit of 2,000 dollars and an 80% experience curve.

| | |
|-----------------------------------|------------------|
| CUM AVG Factor for Unit #1000 | 15867092 |
| Cost of #1 Unit | <u>x \$2,000</u> |
| CUM AVG Cost for first 1000 units | = \$317 |

3. How to determine the total cost for a given number of units, given the cost of the first unit.

The Total Cost for a given number of units can be found - by MULTIPLYING the Cost of Unit #1 by the CUMULATIVE TOTAL factor of the desired number of units.

EXAMPLE: Find the Cumulative Total Cost for 1000 units, using a number one unit of 2,000 dollars and an 80% experience curve.

| | |
|---------------------------------|------------------|
| CUM TOTAL Factor for Unit #1000 | 158.67092133 |
| Cost of #1 Unit | <u>x \$2,000</u> |
| Total Cost for first 1000 units | = \$317,342 |

4. How to determine the total cost for a lot of units between two specific cumulative unit quantities, given the cost of the first unit.

The CUM TOTAL Factor of the last unit in the lot MINUS the CUM TOTAL Factor of the unit just prior to the first unit in the lot MULTIPLIED by the cost of Unit #1 equals the Total Cost of the lot.

EXAMPLE: Find the total Cost of a Lot of 100 units starting at Unit #901 and ending with Unit #1000, with a Unit #1 of \$2,000 and an 80% Experience Curve.

$$\begin{array}{r} \text{CUM TOTAL Factor for Unit \#1000} \\ \text{CUM TOTAL Factor for Unit \#900 (901 - 1)} \\ \hline = 11.000\ 5641 \\ \\ \text{Cost of Unit \#1} \qquad \qquad \qquad \times \$2,000 \\ \hline \text{Total Cost of Lot (units 901 - 1000)} \qquad \qquad \qquad = \$22,000 \end{array}$$

5. How to determine the average cost per unit for a lot of units between the two specific cumulative unit quantities, given the cost of Unit #1.

The Average Cost per unit for a lot can be found - by DIVIDING the Total Cost of the lot (found in Example #4) by the number of units in the lot.

EXAMPLE: Find the Average Cost per unit of a lot of 100 units starting at Unit #901 and ending with Unit #1000, with a Unit #1 of \$2,000 and an 80% Experience Curve.

$$\begin{array}{r} \text{Total Cost of Lot (found in Example \#4)} \\ \text{Number of Units in Lot} \\ \hline \text{Average Cost per Unit of the Lot} \qquad \qquad \qquad = \$220 \end{array}$$

6. How to determine the cost of Unit #1, given the cost of a specific unit.

The Cost of Unit #1 can be found - by DIVIDING the Unit Cost of any specific unit by the UNIT Factor for that specific unit.

EXAMPLE: Find the Cost of the first unit, given a Cost of \$541 for Unit #1000 on an 80% slope.

$$\begin{array}{r} \text{Cost of Unit \#1000} \\ \text{UNIT Factor for Unit \#1000} \\ \hline \text{Cost of Unit \#1} \qquad \qquad \qquad = \$5,000 \end{array}$$

7. How to determine the cost of Unit #1, given the cumulative average cost through a specific number of units.

The Cost of Unit #1 can be found - by DIVIDING the Cumulative Average Cost at any specific unit by the CUM AVERAGE Factor for that specific unit.

EXAMPLE: Find the cost of the first unit, given a Cumulative Average Cost of \$476 through Unit #1000 on an 80% slope.

| | |
|----------------------------------|------------------|
| Cumulative Average at Unit #1000 | \$476 |
| CUM AVG Factor for Unit #1000 | $\div .15867092$ |
| Cost of Unit #1 | = \$3,000 |

8. How to determine the cost of Unit #1, given the cumulative total cost through a specific number of units.

The Cost of Unit #1 can be found - by DIVIDING the Cumulative Total Cost at any specific unit by the CUM TOTAL Factor for that specific unit.

EXAMPLE: Find the Cost for Unit #1, given a Cumulative Total Cost of \$476,000 through Unit #1000 on an 80% slope.

| | |
|-------------------------------------|---------------------|
| Cumulative Total Cost at Unit #1000 | \$476,000 |
| CUM TOTAL Factor for Unit #1000 | $\div 158.67092133$ |
| Cost of Unit #1 | = \$3,000 |

9. How to determine the cost of Unit #1, given the total cost of a lot of units between two specific cumulative unit quantities.

The Cost of Unit #1 can be found - by DIVIDING Total Cost of the Lot by the difference between the CUM TOTAL Factor of the unit at the end of the lot and the CUM TOTAL Factor of the unit just prior to the first unit in the lot.

EXAMPLE: Find the Cost of Unit #1, given a Total Cost of \$22,000 for a lot of 100 units starting at Unit #901 and ending with Unit #1000 on an 80% Experience Curve.

| | |
|--|---------------------------------|
| CUM TOTAL Factor for Unit #1000 | 158.67092133 |
| CUM TOTAL Factor for Unit #900 (901 - 1) | <u>147.67076492</u> |
| Total Cost of Lot | \$22,000 |
| Cost of Unit #1 | $\div 11.00015641$ = \$2,000 |

10. How to determine the cost of Unit #1, given the average cost per unit of a lot between two specific cumulative unit quantities.

The Cost of Unit #1 can be found - by MULTIPLYING the Average Cost per unit by the number of units in the lot to determine the Total Cost of the Lot and following the procedure in Example #9.

EXAMPLE: Find the Cost of Unit #1, given an average cost of \$220 per unit for a lot of 100 units starting at Unit #901 and ending with Unit #1000 on an 80% Experience Curve.

| | |
|------------------------|--------------------------------|
| Average Cost per Unit | \$220 |
| Number of Units in Lot | <u>$\times 100$</u> |
| Total Cost of Lot | \$22,000 |
| (From Example #9) | $\div 11.00015641$ |
| Cost of Unit #1 | = \$2,000 |

11. How to determine the cost for a specific unit which is beyond the range of the tables.

The Cost for a specific unit which is beyond the range of the tables can be found by MULTIPLYING the Experience Curve Extension Factor by the Unit Factor for a unit one-tenth the desired value; then MULTIPLYING this value by the cost of Unit #1.

EXAMPLE: Find the cost of the 6,000th unit using a number one unit cost of \$2,000 and an 80% experience curve.

| | |
|--------------------------------|-------------|
| Unit Factor for Unit #600 | .12753666 |
| Extension Factor for 80% curve | x .47650990 |
| Unit Factor for Unit #6000 | .06077248 |
| Cost of Unit #1 | x \$2,000 |
| Cost of Unit #6000 | = \$121.54 |

12. How to determine the Algebraic mid-point of a lot.

The Experience Curve Tables (Table III) may be used to determine the Algebraic lot mid-point for each lot in the following manner:

- Locate the approximate slope of the experience curve in the tables.
- Locate the Cum Total Factor for the last unit number of the lot.
- Locate the Cum Total Factor for one less than the first unit number in the lot.
- Subtract this Cum Total Factor from Cum Total Factor of last unit in lot and divide result by total number of units in the lot.
- Look up this figure in the Unit Factor Column for the same slope.
- Having located the factor which is closest, look across to the unit number which corresponds to this factor. This unit number is the Algebraic or "True" mid-point of the lot.

EXAMPLE: Find the Algebraic (True) lot mid-point of a lot whose unit range is #101-#1000, using an 80% Experience Curve.

| | |
|------------------------------------|--------------|
| CUM TOTAL Factor for Unit #1000 | 158.67092133 |
| CUM TOTAL Factor for Unit #100 | 32.65081072 |
| | <hr/> |
| | 126.02011061 |
| Number of units in lot | ÷ 900 |
| | <hr/> |
| UNIT Factor for true lot mid-point | .14002235 |
| True Lot mid-point | = #449 |
